For Immediate Release**headwire.com, Inc. introduces innovative Web Content Manager (CMS)**

Powerful, web-based solution enables non-technical users to control their own website content – perfect for small to medium-sized businesses

Lake Forest, Calif., May 1, 2007 – headwire.com, Inc. – an Orange County-based business solutions provider with offices in Berne, Switzerland – today announced the formal roll-out of its new Web Content Manager Solution (CMS). This powerful, web-based software solution transforms inactive websites into dynamic communications channels capable of conveying the latest news and information about a business.

“Our CMS addresses the needs of small to medium-sized businesses to easily maintain and update content on their websites without having to rely upon a third-party,” stated Nicole Hillbrecht, CEO of headwire.com, Inc. “This solution is cost effective, simple to implement, and, most importantly, provides non-technical users with trouble-free updating of web content such as text, photographs, pages, links, etc.,” said Ms. Hillbrecht.

CMS from headwire features easy and secure access through any web browser at any location – in the office, from home, or remotely on the road. The simple interface is designed to work like other commonly used, editing software such as MS Word. The interface template overlays the design and layout of the website making it easy to compose, view, and approve changes before publishing them to a site. A timing feature lets users publish new content and remove it according to a planned schedule. This is especially useful for ongoing marketing campaigns, special offers, etc.

The solution can be easily retrofitted to existing websites with no disruption to the business. It can also be included in any new website developed by headwire. The powerful features of headwire’s CMS allow a website and business to grow in sync with each other.

CMS from headwire, Inc. is a customized implementation of an “Open Source” technology, based upon “JSR-170” industry standards and requires a Java enabled server. As such, it is flexible and scaleable and can also be tailored to meet the needs of larger enterprises to manage and store data.

“We are excited to give local businesses the opportunity to utilize this innovative business solution. With the implementation of our CMS, companies will gain control over their website and a technological independence that they have never experienced before,” stated Ms. Hillbrecht. She continues, “a number of local companies have already expressed interest in our CMS, and we plan some exciting announcements soon.”

About headwire, inc.

headwire.com, Inc. is a business solutions provider located in Lake Forest, CA, with offices in Berne, Switzerland. We develop custom business software applications, enterprise systems, databases, websites, and webportals. Our specialty is Java/J2EE development, and we're proponents of "Open Source."
